

Mammals

Mammals are a kind of animal. Mammals can be found all over the world, on land or in the sea. Dogs, cats, monkeys, and whales are common mammals. People are mammals too.

Mammals are vertebrates, so they have backbones. They are the only kind of animals with fur or hair, except for some insects. Some mammals have two arms and two legs. Marine mammals that live in water, like dolphins and whales, have fins and a tail.

Mammals all feed their babies milk. Other types of animals, like fish and reptiles, can't make milk. Mammals have a kidney as well.

Mammals are warm-blooded, just like birds. This means their bodies can make their own heat from food they eat.

1-Mammals are a kind of:

- a. Animals.
- b. Insects.

2- mammals can be found:

- a. In the sea only..
- b. All over the world..
